- Building bone and teeth structure

The Importance of Mineral Salts for Body Functions

Fluid Balance and Electrolyte Regulation

One of the primary roles of mineral salts is to regulate the movement of water within and outside cells. Electrolytes like sodium, potassium, and chloride create osmotic gradients that control hydration levels.

Key points:

- Sodium (Na?) maintains extracellular fluid volume
- Potassium (K?) is crucial for intracellular fluid balance
- Chloride (Cl?) helps maintain acid-base balance and osmotic pressure

Disruption in electrolyte levels can lead to dehydration, edema, or electrolyte imbalance syndromes, affecting overall health.

Nerve Transmission and Muscle Function

Mineral salts facilitate the transmission of nerve impulses and muscle contractions through electrical signals.

Key points:

- Sodium and potassium ions generate action potentials in nerve cells

Deficiencies can lead to osteoporosis, increased fracture risk, and dental problems.

Enzymatic and Metabolic Processes

Many enzymes require mineral cofactors to function properly.

Key points:

- Zinc, magnesium, and manganese act as cofactors
- Proper mineral levels support metabolism and energy production
- Imbalances can impair enzymatic activity and metabolic health
